

STRATEGIC GROWTH FOR SMART ECONOMY TRANSFORMATION

PROBLEM STATEMENT

Definition of the Problem :

- In Egypt, every ministry works with its own data and systems, with no real connection between them.
- This lack of coordination makes it hard to see how one decision affects other sectors.
- As a result, many government projects face delays, wasted budgets, and repeated mistakes.

CHALLENGES

- Government ministries work independently with no unified data system, leading to conflicting decisions :
 - For example: the Ministry of Transport launches a public transport subsidy while the Ministry of Petroleum raises diesel prices, canceling the subsidy's impact.
 - The Ministry of Agriculture sets a plan to export crops, while the Ministry of Supply restricts exports of the same goods to secure local demand — causing market confusion.
-
-
-

PAIN POINTS

1. Lack of future vision:

Without unified analysis or digital simulation (like a Digital Twin), there's no way to predict the real impact of economic decisions before implementation — causing the same mistakes to be repeated.

2. Massive waste of resources and budgets:

Projects launched by one ministry are often disrupted by decisions from another, leading to lost funding, time, and no tangible outcomes.

GOAL

Build an AI-based system that integrates data from different ministries to predict the impact of policy decisions and suggest better coordinated actions.

The system will act as a smart decision-support tool, helping governments simulate scenarios, avoid conflicting policies, and achieve more efficient and sustainable economic outcomes.

THANK YOU
